

Motionz Portal: go-live checklist

The portal runs on my test accounts today. To go live it needs accounts that Motionz owns, so you control your data, emails and files.

How it works. For items 2, 3 and 4 choose **A** (invite me and I set it up) or **B** (you do it and send me the result). The other items are short steps for you. Never send a password; A is always an invitation you can remove later. My email for invitations: _____. Your time: about 30–45 minutes in total.

The 8 items

	What and why	A: invite me (items 2–4)	B: do it yourself (items 2–4)
1	Portal address where clients sign in	Tell me the address you want, for example <code>portal.motionz.ai</code> . I then send you one DNS record to add where your domain is managed.	
2	Vercel runs the portal	Sign up at vercel.com with a Motionz email. Settings → Members → invite me.	Sign up. Account Settings → Tokens → create a token (7-day expiry). Send it to me privately.
3	Supabase database and uploaded files	Sign up at supabase.com . Create an organization "Motionz". Team → invite me as Developer.	Create a project (region: East US). Project Settings → API: send me the Project URL and both keys privately. I send you one SQL file to run.
4	Resend sends portal emails from <code>no-reply@mail.motionz.ai</code>	Sign up at resend.com . Settings → Team → invite me. I send you 3–4 DNS records to add.	Domains → add <code>mail.motionz.ai</code> and add the DNS records shown. API Keys → create a "Sending" key. Send it to me privately.
5	Google Drive each client's folder, sheets and contract	Signed in to the Google account that should own the client files (about 10 minutes): 1. In Drive, create a folder "Motionz Portal Clients". Leave its sharing on Restricted . 2. Make a copy of the two templates into that account: the Data Sheet template and the Money Leak Calculator. 3. Go to script.google.com → New project → paste the script I send you → Save. 4. Project Settings → Script Properties → add the 4 values I send you. 5. Deploy → New deployment → Web app → Execute as "Me", access "Anyone" → Deploy. Approve the Google prompt. 6. Send me the Web app URL it shows.	
6	Google Cloud key roof measurement tool	Done. You already sent this key and it works. One small step for safety: console.cloud.google.com → APIs & Services → Credentials → open the key → API restrictions → allow only <i>Solar API</i> and <i>Geocoding API</i> → Save.	
7	GoHighLevel sends leads and booked calls to the portal	Create an empty test sub-account ("Portal Test"), push the "Portal workflows" snapshot into it, and make sure my GHL user can see it. On go-live day, with your OK, I point the workflows at the live address and add one trigger so a lead marked Lost leaves the portal. The portal never changes anything in GHL.	

8	Slack lead form requests to #reviews-team	The test connection was made from my Slack user. For go-live: Slack → Apps → "Incoming WebHooks" → Add to Slack → pick the channel → copy the link → paste it in the portal under Admin → Settings & Integrations → Slack messages.
---	---	---

Costs (approximate, check each provider): Vercel free to start, Pro about \$20/month. Supabase free to start, Pro about \$25/month (recommended for backups). Resend free up to 3,000 emails/month. Google Cloud (already set up) pay per use, small. Drive, GHL and Slack: nothing extra.

Good to know

- **Google only shares with Google accounts.** Every staff email you add to the portal must be a Google account (Workspace, or a free Google account created on that email), or that person cannot open client folders and sheets. Today `admin@motionz.ai` is not one. Same for a client who wants to open their sheets or an uploaded contract.
- **Drive access follows the portal.** Admins get every client folder, a CSM gets their own clients, a client gets their own files. Google emails each person a "shared with you" notice. Removing someone from the portal removes their Drive access.
- **The live portal starts empty.** No test clients, leads or staff are carried over.

On go-live day, inside the portal (about 15 minutes)

1. Change the admin password (the current one is a shared test password).
2. Admin → Staff: add your real admins and CSMs (`@motionz.ai` emails). Set each CSM's booking calendar under Edit.
3. Admin → Settings & Integrations → Notification emails: who gets onboarding forms, website requests and lead forms.
4. Admin → Settings & Integrations → Staff sign-in security: emailed sign-in code on or off.
5. Admin → Portal Templates and Video Scripts: check the wording new clients will see.
6. Add your first real client, then paste their GHL Location ID in Admin → GHL Connect.

Please reply with

1. A or B for items 2, 3 and 4
2. The portal address you want
3. The Google account that will own the client files
4. Is the test GHL sub-account ready?
5. Are your `@motionz.ai` emails Google accounts?
